

PRODUCT BRIEF

Understand Today, Plan For a Better Tomorrow

FortressIQ delivers a real-time, data-driven map of your business to help you uncover transformational process insights – across all applications, through each department, and for every single task. No matter what stage of the transformation journey you're in, or what process optimization goals you have, a thorough understanding of your business processes is critical for success. But instead of spending millions of dollars and quarter after quarter trying to understand your business at the DNA level, FortressIQ uncovers detailed insights at scale with automatic, continuous, and intelligent acquisition of process data covering every system in your enterprise.

How it Works

FortressIQ follows the human instead of process logs by using advanced computer vision, machine learning, and artificial intelligence to capture every step in every process across every system. It requires zero integration, is universally compatible, and provides the privacy and security of an on-premise solution.

Our process intelligence platform enables secure, automated business process discovery, modeling, and documentation with accuracy and insights previously unattainable by traditional methods. The result is a crystal-clear view into the current state of your organizational processes, plus easy, real-time monitoring of changes to those processes.

Speed

Capture processes up to 90% faster

Scale

Automatically generate documentation to create your transformation roadmap

Accuracy

Easily capture **100% application coverage** across your enterprise

Efficiency

Frictionless deployment in minutes with no integrations or log files required

FortressIQ process intelligence is delivered through two layers. First, desktop sensors capture a highly granular, task-based event log at the user level and across all systems. This happens automatically, without interrupting users or impeding tasks, and without any integrations to provide an accurate and current system of record. Then, AI-powered process discovery capabilities analyze down to the individual subtask levels to define processes, highlight opportunities for process re-engineering, and identify use cases for automation.

Analyze Every Process for More Opportunities

The core of this technology is a joint AI model which has learned the individual types of objects which compose a software screen, and the meanings of their labels and values. Essentially we can determine every control, like a drop down list box or radio button, the label for that control, along with the data within that control. We then can redact the data leaving only the empty software screen remaining.Security Without Compromises

As part of our ongoing commitment to deliver best-in-class security for our customers, we are audited by an independent auditor to SOC2 type 2, ISO 27001:2013, and HIPAA standards in addition to <u>Privacy Enhanced Gateway</u> <u>(PEG)</u>. Our PEG also helps alleviate security and privacy concerns by using our AI and machine learning capabilities to automatically filter out sensitive data before it leaves your premises, giving you complete control over the data transferred to the FortressIQ platform.

Learn more about how FortressIQ enables accurate, automated process discovery in just a few weeks.

About FortressIQ

FortressIQ enables enterprises to decode work, transform experiences, and enhance workflows with the industry's most advanced process intelligence platform. Using innovative computer vision and artificial intelligence, FortressIQ delivers unprecedented process insights, extremely fast, and with detail and accuracy unattainable with traditional methods. The platform autonomously acquires process data at scale even as processes extend across systems, empowering enterprises to understand, monitor, and improve operations, employee and customer experiences, and every business process. FortressIQ was founded in 2017, and is backed by Lightspeed Venture Partners, Boldstart Ventures, Comcast Ventures, Eniac Ventures, M12 and Tiger Global.
